# Introduction

## RPL

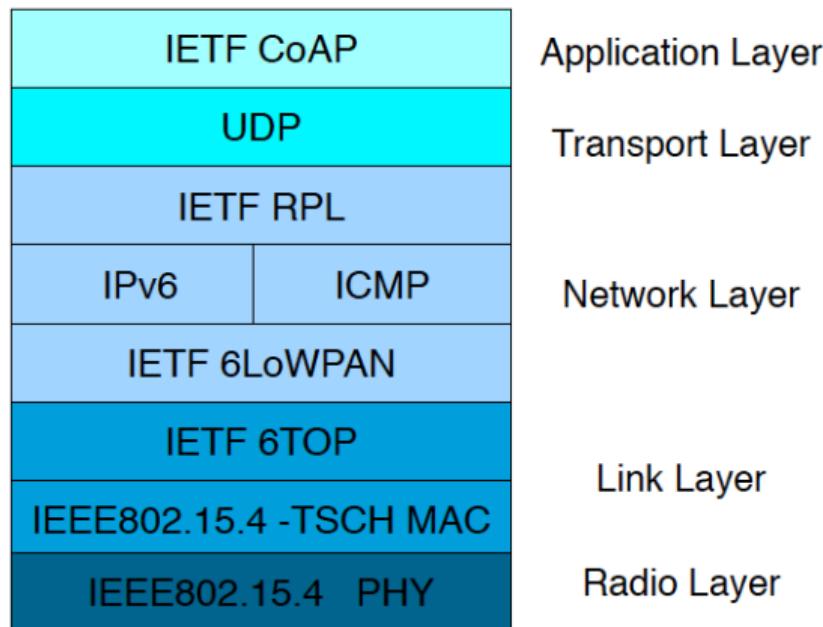

### RPL Implementation in INET

#### Overview

#### Showcase Scenarios

#### Conclusions

Proactive distance-vector routing protocol for Low-Power and Lossy Networks (LLNs).

**Figure 1:** RPL in IETF standardized stack[1]

- IPv6 compatible & Standardized [RFC 6550]
- Scalable
- Point-to-point (P2P), point-to-multipoint (P2MP), multipoint-to-point (MP2P) communication modes
- Configurable objective function per application requirements
- Storing, non-storing modes to match memory constraints
- *Trickle* timer [RFC 6206] enables flexible reactivity behaviour
- DAG inconsistency detection and repair

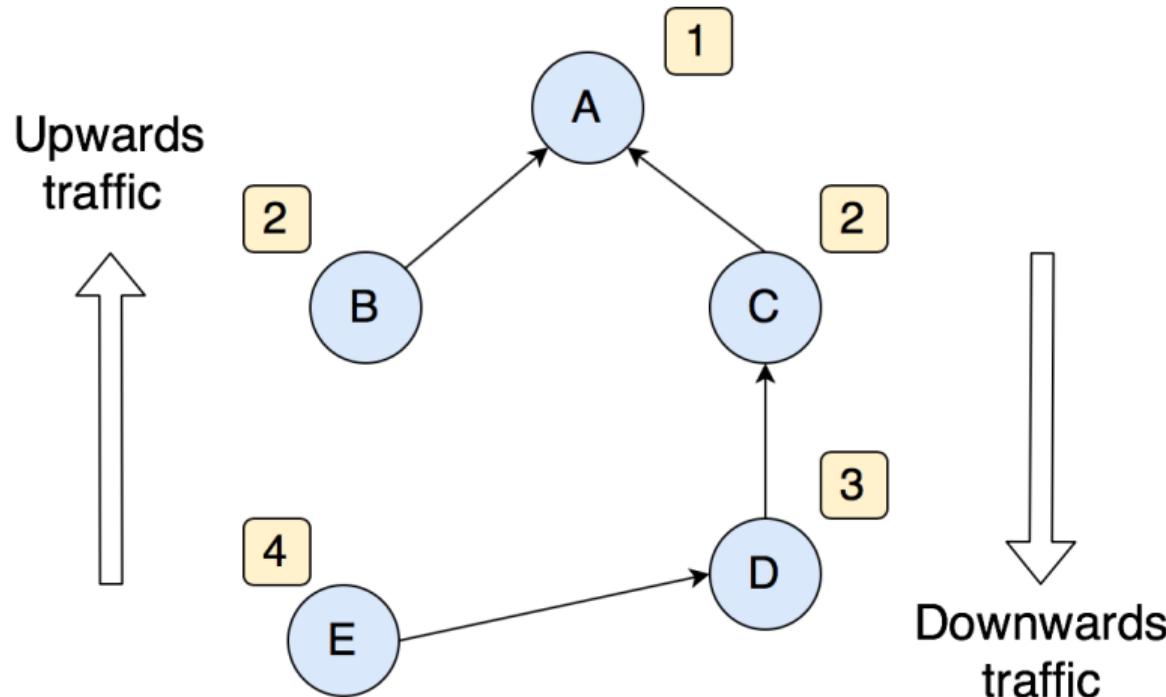

Figure 2: Destination Oriented Directed Acyclic Graph (DODAG)

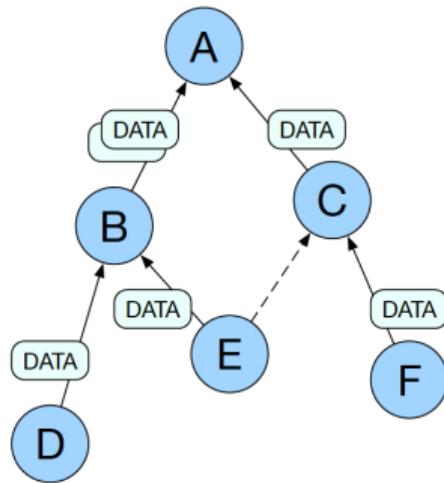

Defines criteria for preferred parent selection

**Table 1:** Some of commonly used objective function metrics [2]

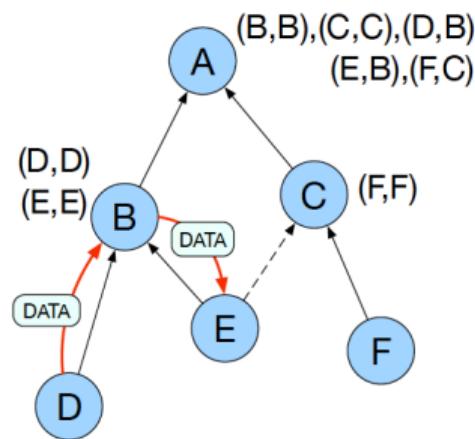

Node Metric	Link Metric
State: CPU, Memory Load etc.	Throughput
Energy	Latency
Hop Count	Reliability

- **DIO** (DODAG Information Option) — topology construction and maintenance
- **DAO** (Destination Advertisement Object) — route discovery, downward forwarding
- **DIS** (DODAG Information Solicitation) — external join request for a DIO

- **Storing** — each node stores routing table of its sub-DODAG
- **Non-storing** — only root has complete routing overview from DAOs

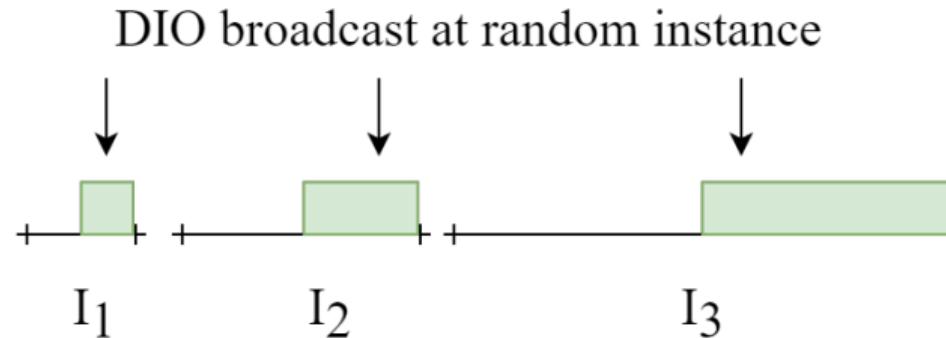

(a) Multipoint-to-point (MP2P)

(b) Point-to-point (P2P)

Figure 3: Traffic flows examples

**Figure 4:** Trickle timer intervals

- Ensures fast topology convergence rate
- Minimizes messaging in stable network

## RPL Implementation in INET

Introduction

RPL

RPL Implementation in INET

Overview

Showcase Scenarios

Conclusions

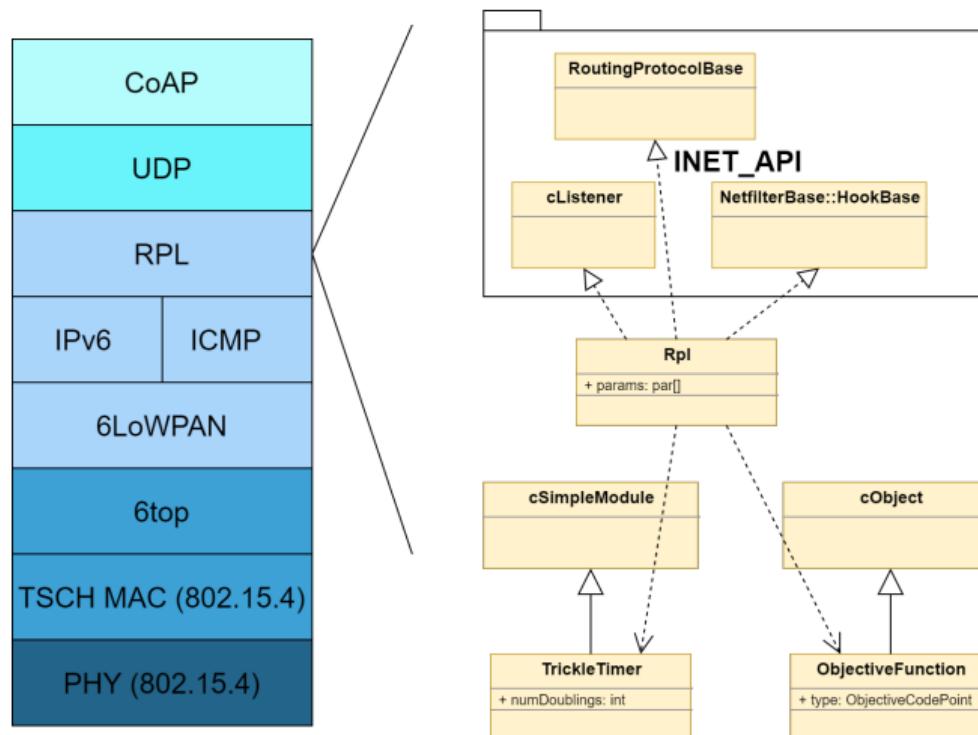

Figure 5: Rpl class diagram

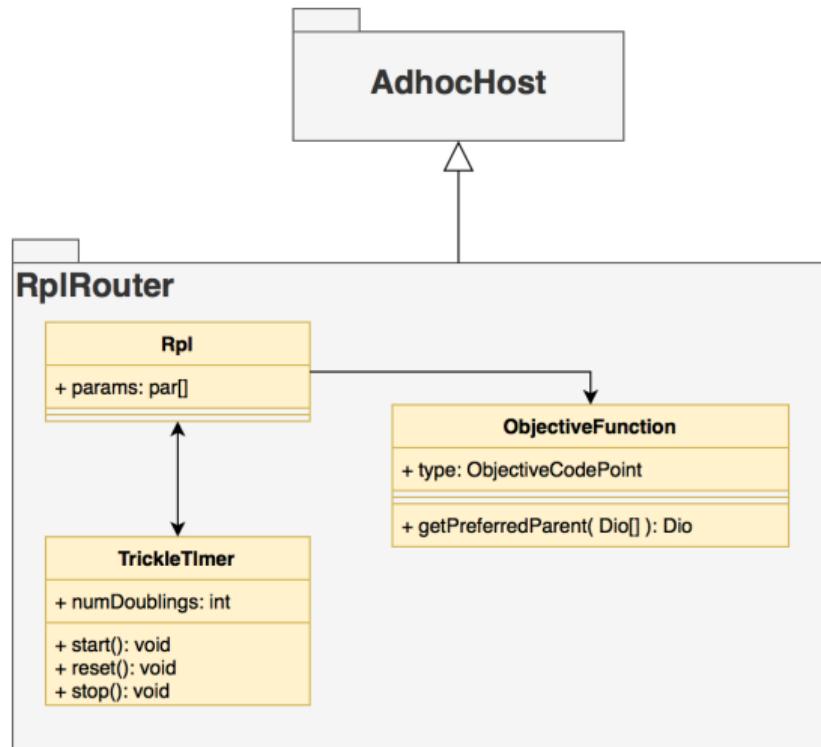

Figure 6: Rpl router module

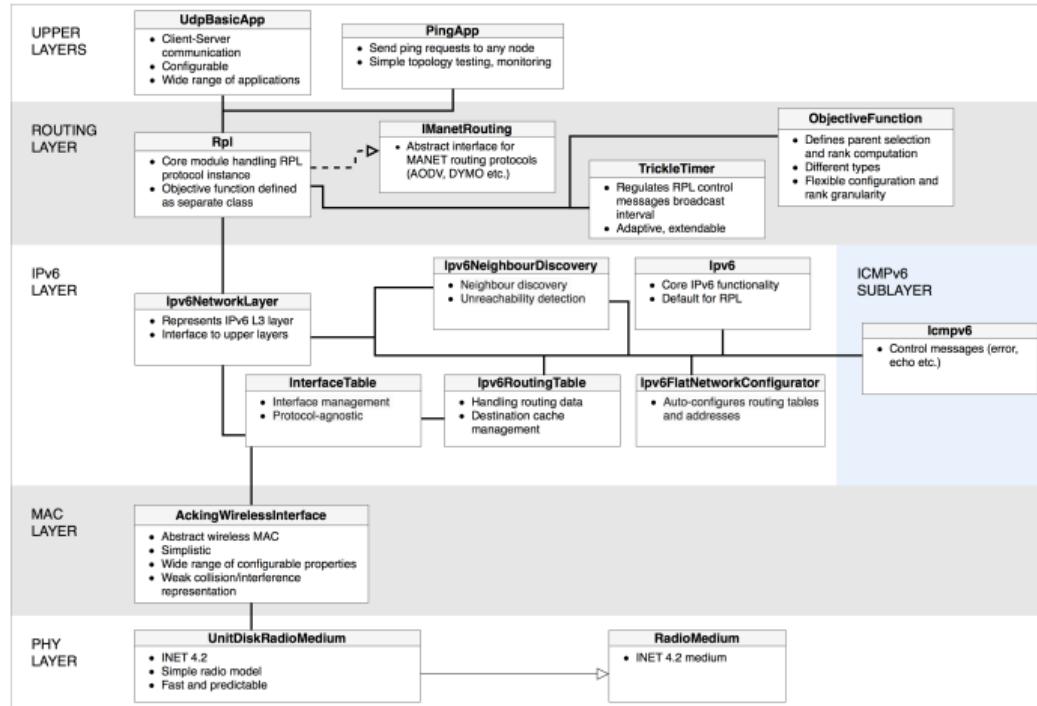

Figure 7: Rpl integration with INET

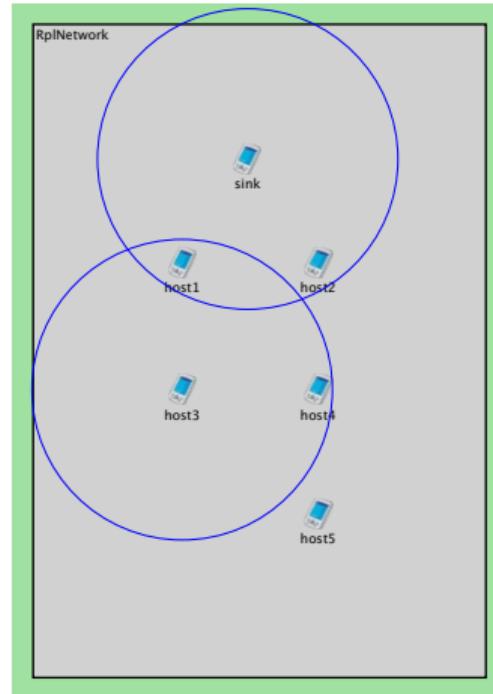

**Table 2:** RPL features implemented based on RFC 6550[3]

<b>Control messages</b>
DIO, DAO
<b>Mode of operation</b>
<ul style="list-style-type: none"><li>• Storing</li><li>• Non-Storing</li></ul>
<b>Traffic flows</b>
<ul style="list-style-type: none"><li>• Multipoint-to-point (MP2P)</li><li>• Point-to-multipoint (P2MP)</li><li>• Point-to-point (P2P, storing only)</li></ul>
<b>Extra</b>
<ul style="list-style-type: none"><li>• Poisoning</li><li>• Loop detection</li></ul>

**Table 3:** Rpl NED-configurable parameters

Name	Description
useBackupAsPreffered	Utilize backup parents to forward remaining packets
daoEnabled	Required for downward routing
storing	Storing\Non-Storing mode of operation
isRoot	Enable root capabilities
poisoning	Poison sub-DODAG upon detaching

1. DODAG construction
2. Multipoint-to-point traffic (static\dynamic)
3. Poisoning
4. Point-to-multipoint traffic
5. Point-to-point traffic
6. Loop detection
  - Rank error
  - Forwarding error

**Figure 8:** Simulation topology

**Table 4:** Simulation parameters

---

Parameter	Value
Communication range	150m
Distance between neighbors	$\approx$ 120m
Transmission interval	uniform(1s, 10s)
Payload	56B
Mobility speed (dynamic scenario)	2mps

---

## Conclusions

---

Achieved:

- RPL core functions according to RFC 6550
- Modular structure
- Basic showcase scenarios and unit testing

Goals for future work:

- Integrate with 6TiSCH stack
- Extend features and documentation per RFC 6550
- Set up CI & improve test coverage
